

Part 2 — Product Understanding

AbleSpace — Take Data Workflow

Full Stack Developer (Fresher) — Technical Assessment

I explored the AbleSpace Caseload and IEP Goal Tracking workflow to understand how an educator or service provider selects a student, opens data collection, records performance against goals/objectives, and reviews the resulting data.

1. Caseload — Selecting a Student

The Caseload screen provides the starting point for student-related work. It lists students and relevant information such as IEP/evaluation dates, collaborators and service time. Selecting a student opens the student's detailed workspace.

2. Student Workspace — Starting Data Collection

Inside the student workspace, the educator can view student information and navigate to areas such as Goals, Worksheets, Notes, Service Time, Progress and other records. The prominent “Take Data” action provides a direct entry point into performance data collection for the selected student.

3. Take Data — Goal-Based Data Collection

The Take Data screen is organized around the student's goals. Goals are shown in a left-side list, while the selected goal is displayed in the main capture area. The workflow supports trial-based recording

and provides controls for recording performance. The interface also provides access to Notes and Lesson Plan information.

4. Data Recording and Review

During data collection, the educator records the outcome of each opportunity/trial. Depending on the goal's measurement type, the interface can capture information such as correct/incorrect responses, prompts or cues, attempts and accuracy. The recorded information is then available in the Data area for later review and filtering.

Session	Student Name	Goal/Objective	Data
08/19/2026 06:59 PM New Session Updated: 1 second ago	DS Demo student1	—	—
08/19/2026 06:45 PM New Session Updated: 3 minutes ago	DS Demo student1	2. Writing Demo Student1 will write his name legiti	D, E, M, O
01/01/2023 11:25 AM New Session	DS Demo student1	1. Social Studies Demo Student1 will take 5 bites, from a	1
	DS Demo student1	4. Reading Demo Student1 will answer "Wh" questio	Answer Who: No Resp Answer What: No Resp +2 More
	DS Demo student2	1. Reading Demo Student2 will be able to identify 4	Red: Refused Yellow: Refused +3 More
	DS Demo student2	6. Writing Demo Student2 will write 5 sentences, f	1
01/06/2023	DS Demo student1	1. Social Studies	2

The Data screen provides a historical view with columns for session, student, goal/objective, recorded data and notes. It also supports filtering by student, goals, measurements and sessions.

5. End-to-End Workflow

1. Open Caseload and locate the required student.
2. Open the student's workspace and choose Take Data.
3. Review the student's available goals/objectives.
4. Select the goal being measured.
5. Record performance for the current trial/opportunity.
6. Repeat for additional trials or goals as required.
7. Add notes or lesson-plan information when useful.

8. Review the recorded information later through the Data/history view.

6. UX/UI Improvements Identified

Faster live data entry — The data-entry controls should prioritize large, easily tappable actions and keyboard-friendly interactions because data may be recorded during an active teaching or therapy session.

Persistent context — Keep the student name, selected goal/objective and current session clearly visible throughout data entry to reduce the risk of recording data against the wrong context.

Unsaved-data protection — Warn users before leaving an active session with unsubmitted trials, and preserve an in-progress session where practical.

Clear save confirmation — After a data point is recorded or a session is saved, provide an immediate, unambiguous confirmation and show the updated count/accuracy where applicable.

Better mobile ergonomics — On smaller screens, prioritize the selected goal and recording controls while collapsing secondary information into accessible sections.

Goal search and filtering — For students with many goals, allow quick search/filtering and optionally pin frequently used goals to reduce scrolling during a session.

7. Functionality Improvements

- Auto-save or draft recovery for an active data-collection session.
- Undo for the most recent recorded trial without losing the rest of the session.
- A quick “repeat last measurement” action for repeated trials.
- Bulk review/edit of recorded trials before final submission.
- A concise session summary showing attempts, correct responses, prompts and calculated accuracy.
- Keyboard shortcuts for high-frequency actions where appropriate.
- Clear validation when required goal/measurement information is missing.

8. Product Takeaway

The key product insight is that Take Data is a high-frequency workflow rather than a general reporting screen. The best experience therefore minimizes navigation, keeps the student/goal context visible, makes recording extremely fast, and protects the user's work. Historical data and reporting are important, but the live capture experience should remain the primary interaction focus.

Submission Checklist

- ☐ Part 2 document with workflow screenshots and explanations

- ☐ UX/UI improvements identified
- ☐ Functionality improvements identified
- ☐ Public GitHub repository
- ☐ Working deployed URL
- ☐ README included
- ☐ Multiple small, meaningful commits
- ☐ Repository and deployment kept accessible for at least 45 days
